

# Soil Moisture Active Passive Mission SMAP

## Level 2/3 Passive Soil Moisture Products

Steven Chan, JPL

Rajat Bindlish, USDA SSAI

Peggy O'Neill, NASA GSFC

Eni Njoku, JPL

Tom Jackson, USDA ARS

### 4<sup>th</sup> Cal/Val Workshop

Pasadena, CA

November 5-7, 2013

# SMAP L2\_SM\_P At a Glance

- Derived from SMAP TB and ancillary data.
- Processed and posted on global 36-km EASE2-Grid projection.
- Soil moisture retrieved using Single Channel Algorithm (SCA).
- 6:00 am descending passes only.
- Project science requirements:

*"The baseline science mission shall provide estimates of soil moisture in the top 5 cm of soil with an error of no greater than  $0.04 \text{ cm}^3/\text{cm}^3$  (one sigma) at 10 km spatial resolution and 3-day average intervals over the global land area excluding regions of snow and ice, frozen ground, mountainous topography, open water, urban areas, and vegetation with water content greater than  $5 \text{ kg/m}^2$  (averaged over the spatial resolution scale)."*

*"SMAP shall provide a Level 2 data product (L2\_SM\_P) at 40 km spatial resolution representing the average soil moisture in the top 5 cm of soil."*

# L2\_SM\_P in Phase 1 Cal/Val Rehearsal

- L2\_SM\_P simulated using SMOS TB:
    - SMOS 6:00 am TB interpolated at 40 deg (same as SMAP incidence angle) on EASE2 Grid
    - SMAP ancillary data on EASE2 Grid
    - SCA applied, adjusted for effects of water, vegetation, surface temperature, and roughness.
    - Output packaged in hdf5
  - L2\_SM\_P soil moisture retrieval extracted at core validation sites.
  - Matchup continuously updated as new data became available during rehearsal.
  - Validation metrics computed from L2\_SM\_P soil moisture retrieval time series and in-situ soil moisture time series at core validation sites.
-

# L2\_SM\_P Phase 1 Cal/Val Core Sites

Calibrated in-situ data available in some sites only

Core sites	36-km EASE2 indices (row,col)	3-km EASE2 indices (row,col)
Little Washita, OK, USA	(87,220)	(1042,2633)
Little River, GA, USA	(97,259)	(1158,3097)
Reynolds Creek, ID, USA	(64,170)	(768,2032)
Walnut Gulch, AZ, USA	(97,188)	(1155,2248)
Fort Cobb, OK, USA	(86,219)	(1026,2618)
St. Josephs, IN, USA	(69,255)	(823,3053)
South Fork, IA, USA	(66,232)	(790,2782)
Tonzi Ranch, CA, USA	(77,159)	(921,1897)
REMEDHUS1, Spain	(69,468)	(827,5611)
Valencia1, Spain	(74,479)	(883,5743)
Yanco1, Australia	(319,874)	(3825,10479)
Yanco2, Australia	(320,874)	(3834,10486)
Kyeamba, Australia	(321,878)	(3848,10526)
Bell Ville, Argentina	(310,310)	(3711,3713)

# L2\_SM\_P at USDA Core Sites

Five-month comparison between simulated L2\_SM\_P and calibrated in-situ soil moisture data from USDA ARS watershed sites

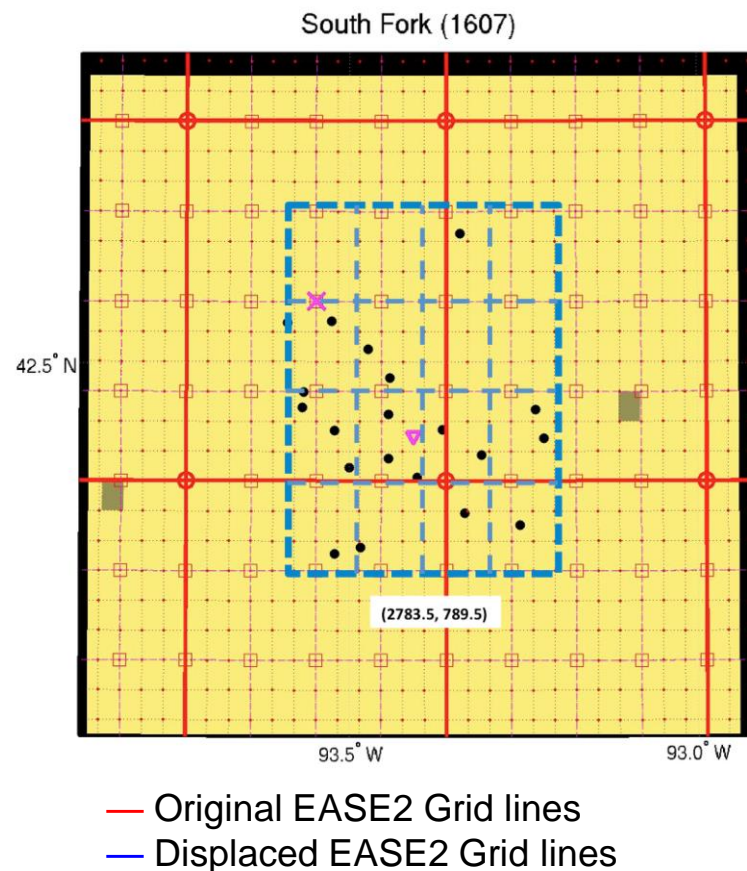

- High temporal correlation: *SMOS TB registered actual soil moisture variability.*
- RMSE = 0.036 cm<sup>3</sup>/cm<sup>3</sup>: *L2\_SM\_P's accuracy meets SMAP science requirement with very small bias.*
- Longer data records needed to more accurately estimate of L2\_SM\_P's performance.

# Displaced Pixel L2\_SM\_P Retrieval

- During Phase 1 Cal/Val Rehearsal, we noticed:
  - Individual sensors in certain sites are not uniformly distributed within a 36-km grid cell
  - Some sites even have sensors covering multiple 36-km grid cells
  - Potential increase in uncertainty in comparison between satellite retrieval and in-situ data
- Solution: Displace L2\_SM\_P nominal processing domain (on 36-km EASE2 Grid) in small increments (multiples of 3 km) to better match the actual distribution of individual sensors.

# Displaced Pixel L2\_SM\_P Retrieval

## Steps:

- Start with Level 1 time-ordered SMOS 40-deg data (TB, TSURF, and VSM)
  - Express displaced 36-km processing domain in 3-km EASE2 (row,col) bounding indices
  - [A] Bin TB and TSURF in displaced 36-km grid cells
  - [B] Bin 3-km ancillary data (NDVI, VWC, soil texture) in displaced 36-km grid cells
  - Use [A] and [B] to perform Displaced Pixel L2\_SM\_P Retrieval using optimal coefficients obtained without displacement
-

# Displaced Pixel Retrieval: Before vs. After

- Not much difference in L2\_SM\_P retrieval on original EASE2 Grid vs. displaced EASE2 Grid
- Expected because % displacement in TB main beam IFOV is small
- Time-consuming, can't run operationally without 'forking out' SPS inversion module and running it in a different environment, output format not compatible with SMAP product specifications

# Conclusion

- Postlaunch Cal/Val of L2\_SM\_P successfully tested using simulated L2\_SM\_P derived from SMOS.
  - Time-series comparison with calibrated in-situ data demonstrated L2\_SM\_P's accuracy meets the SMAP science requirement ( $RMSE < 0.04 \text{ cm}^3/\text{cm}^3$ ).
  - Potential value of Displaced Pixel L2\_SM\_P Retrieval explored. Small change in retrieved soil moisture does not justify the code complexity and software maintenance involved.
  - Ongoing work on Phase 2 Cal/Val Rehearsal.
