MOTIVATION for BETTER SOIL MOISTURE in NWP MODELS

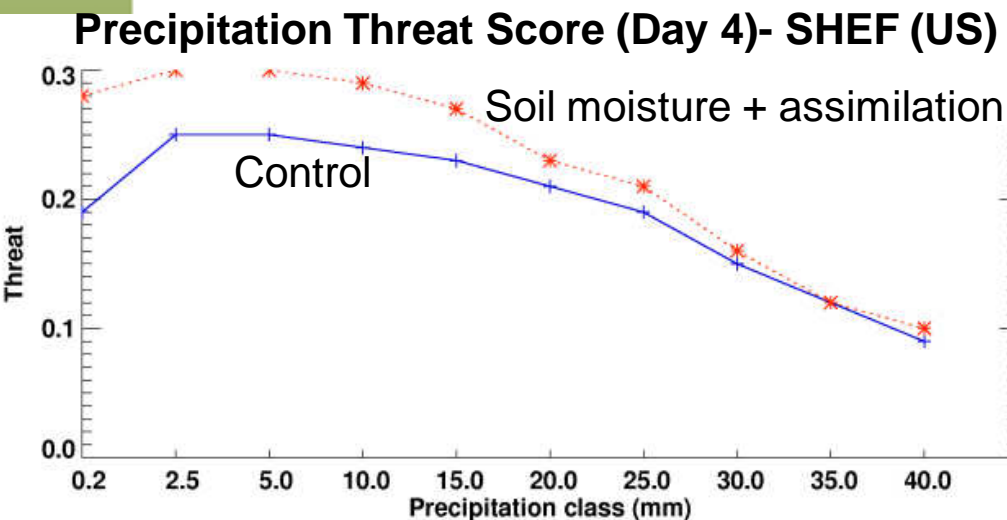

1 NEAR-SURFACE AIR CONDITIONS

2 BOUNDARY-LAYER and MIXING

3 CLOUDS and PRECIPITATION

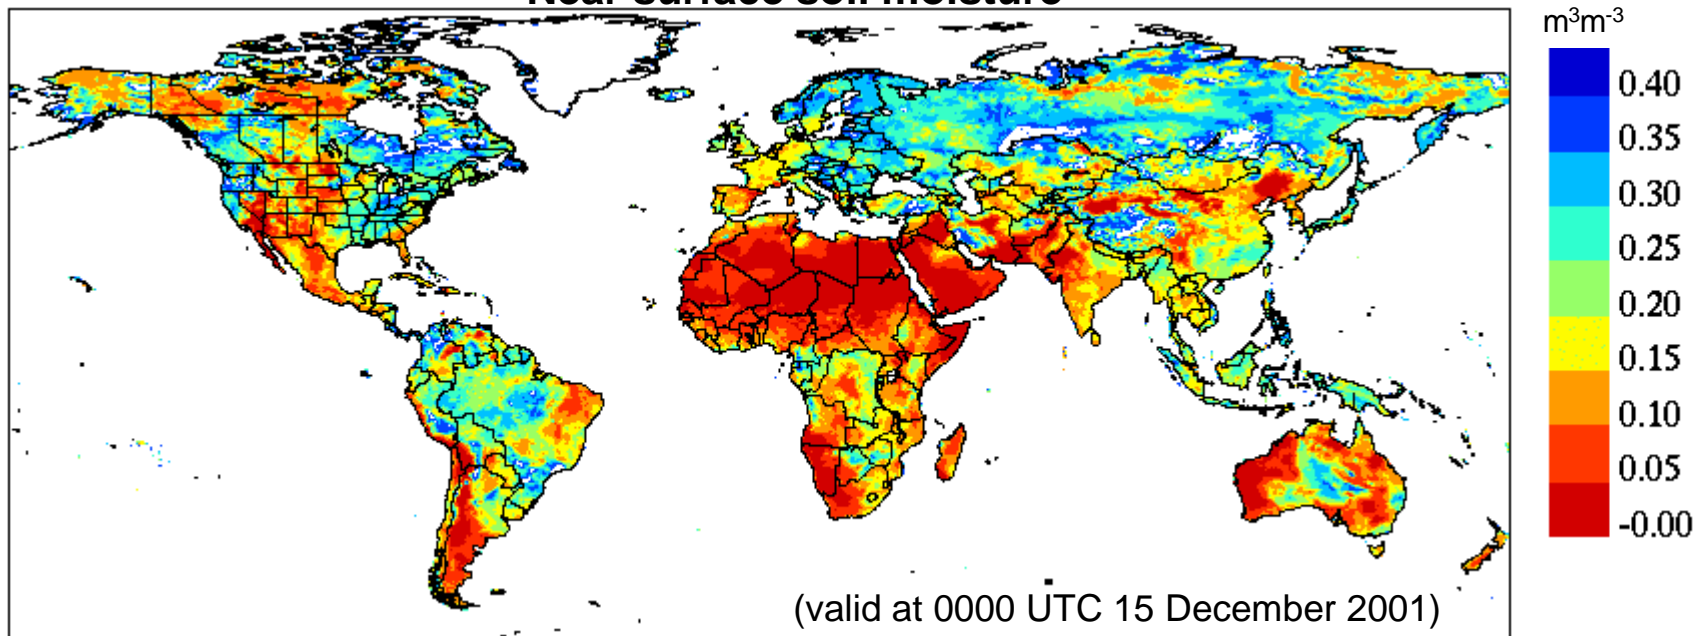

1 and 2: Implementation of short-range regional system in 2001. 48 cases (summertime)

3. Implementation of global medium-range in 2006. 116 cases (summertime)

POSSIBLE IMPROVEMENT at MEDIUM-RANGE (GLOBAL MODEL)

Near surface soil moisture

OTHER ASPECTS BECOMING MORE IMPORTANT SOIL MOISTURE and AIR QUALITY / DISPERSION

SMAP DATA in the ENSEMBLE KALMAN FILTER of the CANADIAN LAND DATA ASSIMILATION SYSTEM (CaLDAS)

SMAP DATA in the ENSEMBLE KALMAN FILTER of the CANADIAN LAND DATA ASSIMILATION SYSTEM (CaLDAS)

ANCILLARY DATA for the ASSIMILATION of SMAP DATA

FORCING DATA (perturbed)

Analyses or best estimates of:

Precipitation (quantity and phase)

Radiation incident at surface (LW and SW – direct and diffuse)

Low-level air temperature

Low-level air humidity

Low-level winds

GEO DATA

Information on:

Orography (DEM)

Land / water coverage fractions (databases)

Soil texture (databases)

Vegetation type (databases / remote sensing)

Vegetation conditions, i.e., LAI (analysis based on remote sensing)

Urban cover types (databases)

Snow conditions, i.e., coverage at least (analyses)

Surface temperature (analyses)

RESEARCH and DEVELOPMENT ISSUES

Assimilation of SMAP data

Specification of background and observations error covariances

Role and impact of other data (i.e., screen-level obs)

Impact of SMAP data

Impact on boundary layer, clouds, and precipitation is expected

Impact on large-scale upper-air features?

Ancillary data

Atmospheric forcing (e.g., precipitation) of crucial importance

Geophysical data (soil texture not that good)

Vegetation analysis (combination of satellite and model products)

THANK YOU for your ATTENTION

SOIL MOISTURE at ENVIRONMENT CANADA

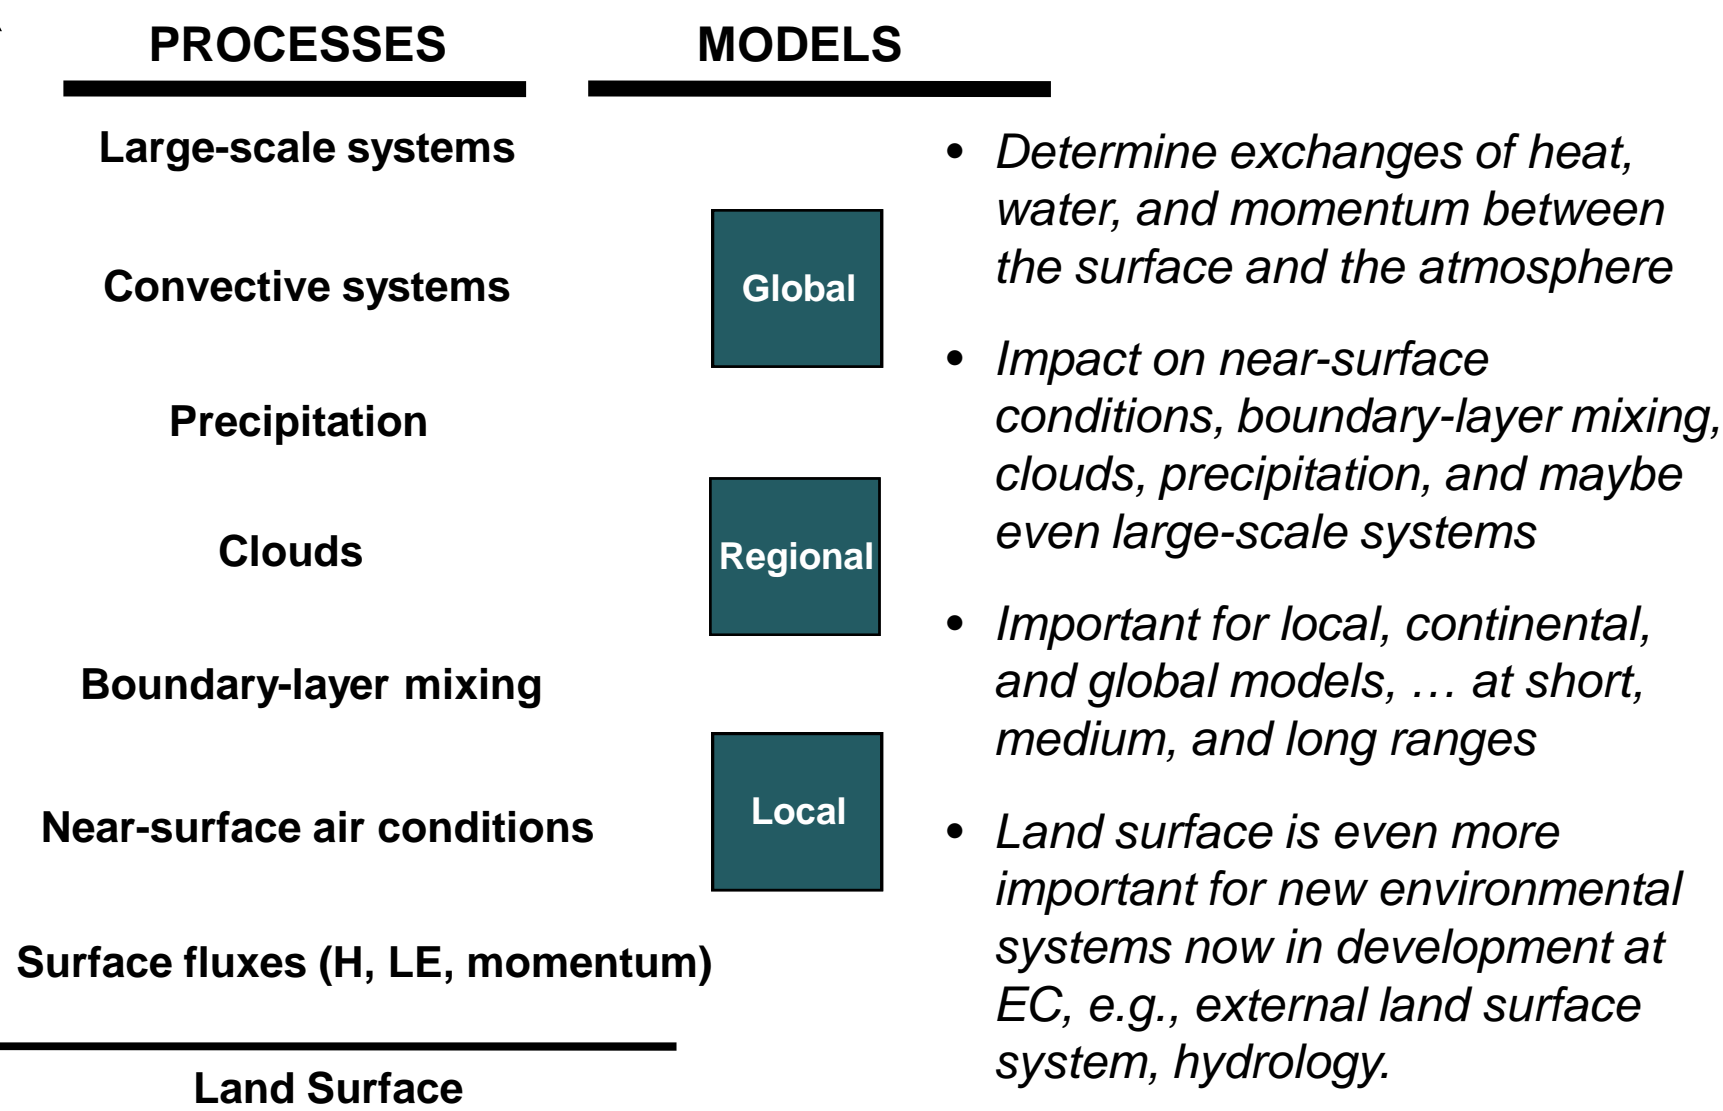

HISTORICAL PERSPECTIVE

- 1986** *Force-restore scheme with a time-evolving “soil wetness” variable. Initial conditions provided by a “climatology”*
- 1995** *Simple assimilation of soil moisture based on screen-level air temperature and humidity*
- 2001** *Land surface scheme with a soil moisture variable. Improved method for the initial conditions, but still based on screen-level data (regional, short-range system)*
- 2006** *Same but for the global, medium-range system*
-
- 2011?** *Assimilation of SMOS passive data*
- 2014?** *Assimilation of SMAP passive and active data*

THERMODYNAMIC versus MOMENTUM SURFACE FLUXES

... Based on our experience at EC

THERMO

- H and LE surface fluxes
- Surface temperatures
- Soil moisture
- Water / land fractions

Significant impact on boundary layer, clouds, and precipitation. But not clear yet how it influences large-scale upper-air features

Environnement
Canada

Environnement
Canada

MOMENTUM

- Resolved orography
- Blocking effect (subgrid-scale)
- Turbulent mixing (subgrid-scale)

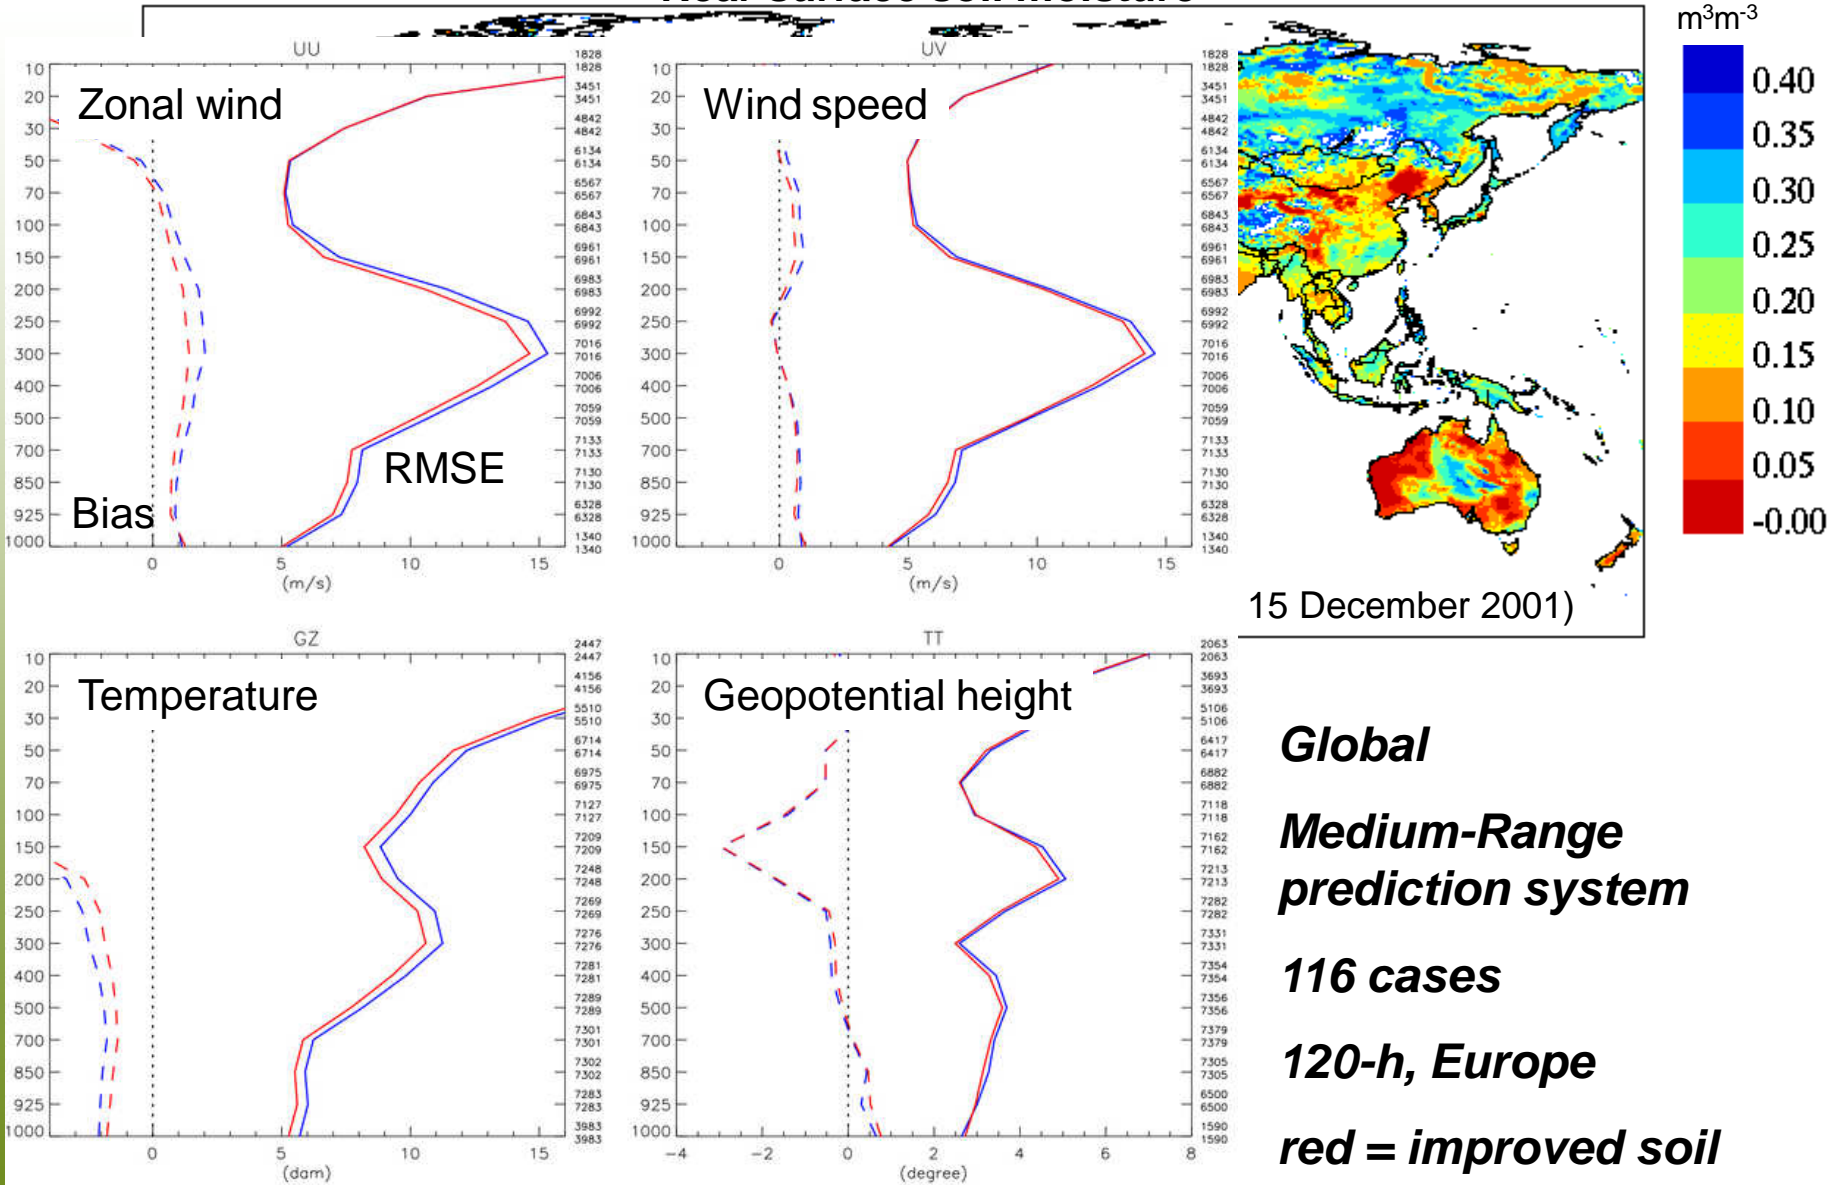

Significant impact on large-scale features, but not on clouds and precipitation

Canada

POSSIBLE IMPROVEMENT at MEDIUM-RANGE (GLOBAL MODEL)

Near surface soil moisture

**Global
Medium-Range

Canada

POSSIBLE IMPROVEMENT at MEDIUM-RANGE (GLOBAL MODEL)

Near surface soil moisture

Significant impact for this region... but not always like this. Impact on medium-range upper-air prediction still TBD

**Global
Medium-Range
prediction system**

116 cases

120-h, Europe

**red = improved soil
moisture**
